

August 25th 2004

What I've Done

- Brainstormed possible project ideas
 - Research based project on Network Security
 - Programming based project
 - Custom-made tax software for grandfather's small tax business.
 - Design new systems for local grocery store (where I work)
 - Programming projects for my dad's job at a chemical plant.

What I hope to accomplish

- Determine what projects are even possible.
- Determine what possible projects are feasible.
- Choosing a project that
 - I have the skill to work on.
 - I have the tools available to help me.
 - I can enjoy doing.

September 1, 2004

This Week's Progress

- Still contemplating a few different project ideas.
- Talked to Diane Till, who owns her own Disc Jockey business.
- Problem: Diane currently fulfills orders from customers who call or visit her in person by handwriting her own order forms. She would like a more efficient way to complete orders for her customers, as well as maintain an inventory of her DJ equipment, with the hopes of possibly integrating orders via the web in the future.
- Possible solution: A JAVA based program that Diane can access order forms, print receipts and contracts, a working inventory of her equipment, as well as keep track of new and returning customers.

September 15, 2004

What I've Done

- Chose a project that I think will be worthwhile.
- Making a JAVA or C++ based program for Diane Till for her Disc Jockey Business.
- What she wants to be implemented:
 - Ordering system that can print a detailed bill for the customer.
 - Database of customers
 - Database of all music and equipment.

What I hope to accomplish

- Hopefully provide preliminary screenshots that will give Diane an idea of the layout of the program.
 - This will allow her to give me more customization ideas for the program.
- Design and program a main menu.
 - Give a first time feel for the program.

October 13, 2004

Accomplishments

- Current design plan is to write my senior project in JAVA and have it connect to an SQL Database.
- SQL(Structured Query Language)- a specialized programming language used to get information into and out of relational databases.

Accomplishments

- Downloaded MySQL
 - Open Source RDBMS (Relational Database Management System)
 - Noted for its speed, reliability, and flexibility.
 - Use this database server to execute commands which allow for creation and modification of databases.
 - Command line driven.

Accomplishments

- To get familiar with SQL and JAVA connectivity, I created a sample SQL database, then wrote a JAVA application that accepts an SQL query (a request for information) and displays the results of the query in a JAVA table.

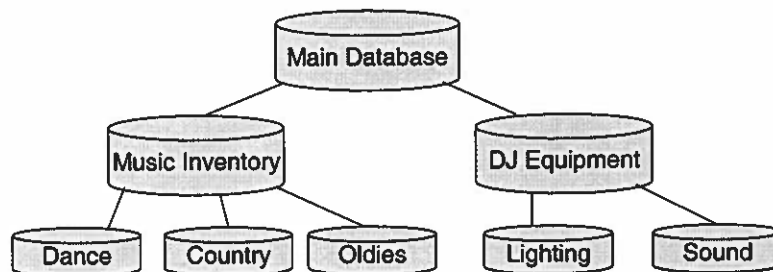

Important Notes of Interest

- Must have a driver present on the computer in order to connect to an SQL database. Must also specify location of SQL database
 - static final String JDBC_DRIVER = "com.mysql.jdbc.Driver";
 - static final String DATABASE_URL = "jdbc:mysql:///poster";
 - private Connection connection;
 - connection = DriverManager.getConnection(DATABASE_URL, "username", "password");
- Note, SQL databases require usernames and passwords for authorization purposes.

October 13, 2004

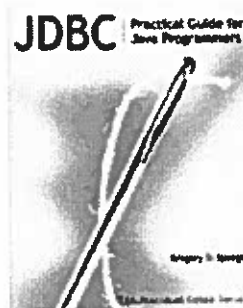

Goals for my Project

- Create SQL databases specific for my client.
- Organize databases, for example..

"Music Unlimited"

Disc Jockey Services by Diane
for Special Parties and Events

GIFT CERTIFICATE

Presented to: _____

Date Awarded: _____

*This certificate entitles the bearer to 4 Hours of service
worth \$4000.00 good for one year
only on available calendar dates from 8/23/96 - 8/23/1997.*

Expires _____

Call Diane Till at 873-8471 to arrange your Date & Time that is available.

This Certificate is verification that you donated to the Silent Auction for the MUSC Children's Hospital and must be given to "Music Unlimited" at time of service.

Project Name: Music Unlimited Order and Inventory System

Project Purpose: To provide the user, Diane Till, a quick and efficient way to create, manage, and track orders that she receives for her Disc Jockey business. In addition, the system will allow Mrs. Till to computerize the music and other equipment used for the business, which will give her total knowledge of and about her inventory.

Anticipated Completion: End of April, 2005

Approved Budget: No budget.

Key Participants:

Participant	Position	Primary Responsibilities
Chad Droze	Project Manager	Manage the entire project
Diane Till	Owner, Music Unlimited	User of the System
Roger Hughes	Tester	Test the System before it is implemented
Jack Briner	Advisor	Oversees the project

Interview Questions for Diane Till
January 25, 2005

- 1) Can you give me a brief history of your company?
- 2) Can you take me through the process of fulfilling an order for one of your customers?
- 3) What necessary features should the program provide?
- 4) What features, time permitting, would you like to see added to the program?
- 5) How do you currently keep track of your inventory?
- 6) Do you have any company logos or images that could be used in the program?

Chad Droze
Music Unlimited Ordering and Inventory System
Implementation Phase Milestones

January 5, 2005

Description: Started on a User Login Page that will serve as a "security measure" to the application. Not a critical step, but I thought it was a nice feature. Will ask about it during next meeting with client. Need to request a company logo for the login page.

Need: Logo for Company

File: FirstScreen.java

January 11, 2005

Description: Successfully created first "Login" screen of my JAVA application. It accepts a username and password, and checks to see if the information is correct via a message dialog box.

File: FirstScreen.java

January 12, 2005

Description: Started working on the Main Menu of the Program. Right now, the application has an image of a dj with 4 buttons listed below. My ideas for the buttons are as follows:

New Customer Button- Takes you straight to the Order Page

Returning Customer Button- A dialog box (which also has a cancel button in case of a mistake) which has a drop down menu of all customers sorted alphabetically by last name.

Inventory Button- Button will trigger a pop up menu that will allow the user to select other options (add music, add equipment, etc.)

Exit Button- Will show a dialog box that contains a progress meter of the program shutting down. This is a fancy widget added that really serves no purpose other than experimenting with the tool.

Right now, I have made events for each of the 4 buttons. If exit is chosen, a dialog box pops up saying "exiting program.". If any of the remaining 3 is clicked, a dialog box pops up saying "not exiting program."

Need: Better understanding of JAVA layouts for quicker completion of an application.

File: MainMenu.java

January 13, 2005

Description: Modified the MainMenu.java program a bit. Tried to add a popup menu to the inventory button (will let the user further choose to add new music or add new equipment). Unsuccessful. I then created a rough-draft of the order form complete with tabbed panels (customer, party, and music info). Started laying out the textboxes for the first panel (customer information- first name, last name, address, etc.). Couldn't get the layout right (used GridBagLayout).

Need: Need to figure out if the GridBagLayout works, that way I can easily and quickly lay out the many text boxes, combo boxes, and buttons that I need on each panel.

Files: MainMenu.java and OrderScreen.java

January 16, 2005

Description: I got a difficult task complete today. I learned how GridBagLayouts work in JAVA, and got the layout of my form semi-like I need it to look. What I need to do for the remaining forms is to use Visio to draw out my forms, and then put them on a grid, that way I can refer to the drawing when putting in the parameters to my layout function. I will do that at another time. As of now, all labels correspond to their respective textbox or textarea on the first tab, and the layout is coming along nicely.

Need: I need to fix tab traversal on my text area for the address field. I want my client to be able to tab through the boxes, but when I get to the text area, it doesn't want to continue tabbing, instead it makes the text area bigger. I'm sure it's just one line of code to add, however, so I'm not stressing over it too much. Also need to learn how to get all these files to communicate to each other.

File: OrderScreen.java

January 22, 2005

Description: A continuation from my last update. I added every component on all tabs, (even added another tab). Now, every field in the database has its own textbox, textarea, or combobox. I also learned how to add borders around components using the Border class. I did this and added thin black borders around the text area boxes.

Need: Right now, every component is lined up vertically in the center. My next task is to layout the components within the entire space of the tab panel.

File: OrderScreen.java

January 24, 2005

Description: For both my Algorithms and Mobile Networks class, we were to download a JAVA IDE from the Sun website for our class projects and labs. Java Netbeans is an IDE that contains a compiler that will allow you to compile JAVA code. It works basically the same as Visual Studio from Microsoft. I was able to compile my ongoing project, and it saves me time from having to go to the command prompt and compile source code from there. Should allow me more time to work on other critical tasks.

February 1, 2005

Description: Messed around with the layout of the first two tab panels. Got a more pleasing layout than when I just laid out the components vertically. Still need to work my skills with the GridBagLayout, however. Used NetBeans, and things went very smoothly.

File: OrderScreen.java

March 24, 2005

Description: Finally set aside some time to do some much needed work with my Senior Project. I actually got the OrderScreen.java file to successfully pull information from an SQL Database and into the correct textboxes. In OrderScreen.java, If the customer is a returning customer, then you choose the customer from a combo box (which will have to be arranged in alphabetical order in the case of many customers). For whichever choice you choose, the General Customer Information is displayed into the corresponding textboxes. Finally, some progress with the SQL side of my project.

File: OrderScreen.java

March 29, 2005

Description: Wanted to create the layout of the forms of my client, but was having a hard time mastering the many layouts that JAVA has. I found this free program called JAVA Gui Builder that actually constructs the layout of your JAVA program. The program is amazingly simple and effective. It's very basic, but would have saved me a lot of time with programming the GUI. I got the Wedding Reception Form laid out exactly the way I wanted it (3 pages total).

File: WForm1.java, WForm2.java, WForm3.java

March 30, 2005

Description: Created some basic checkbox listeners that should be useful in my program. When checked (or unchecked), certain labels, radio buttons, and text boxes become enabled (or disabled). This is a welcome addition to the program. Only did it with WForm1.java, but need to duplicate the same strategy for the remaining two pages of the Wedding Reception Form.

File: WForm1.java

April 4, 2005

Description: Talked to Dr. Briner today. Made the decision to extend my Senior Project until July, since I'll be graduating then.

April 6, 2005

Description: Sort of found a fix to a problem I have been having since the Construction Phase. I have a Sign in screen, but when I wanted to proceed to the Main Menu, the Sign in Screen would stay open. So, I found a method called dispose() that releases all the resources and closes the window, allowing just one window to appear at a time. However, when I click the X button to close the program, the command window does not recognize this, and I have to manually close the program in the command window by pressing CTRL + c. But it temporarily solves my problem.

File: FirstScreen.java & MainMenu.java

April 11, 2005

Description: Fixed the layout of the Music Selection Tab with JLists and started writing code for it. The List is of Multiple Selection Type- meaning you can select more than one element of the list, which is necessary to be able to do. I started writing event listeners for the buttons. Add to List buttons take the current selections of the JList and updates another working list containing the current music selections for this party or event. Still need to fine tune these listeners, though. Also, created the Orders Table in my SQL Database.

File: OrderScreen.java

April 21, 2005

Description: Added another tab to the Order Screen called Complete Orders. This tab will have buttons that will perform actions such as sending the data to the database, printing forms, etc. This is necessary for the program. Only have the layout done so far, as functionality is not yet up and working.

File: OrderScreen.java

May 4, 2005

Description: After a while, I successfully added new customers to the SQL Database. When you click on new customer, I fill out the customer information and click the button labeled "Save to Database", it will save all information about the new customer to the table. Obviously, if the customer is returning, there is no need to resave his information, so my program will not upload customer information. Later on, I will use what I created here to send party information to the table.

File: OrderScreen.java

May 5, 2005

Description: For the list boxes on the Music Information Tab (where the user chooses certain types of genres, albums, artists, and songs), I created the Albums table in the database and had the albums list box in my program pull its elements from the database using JDBC. This technique will be repeated for the remaining list boxes, which is relatively simple to do. Later on, I will add the ability to add albums to the database from my Java application itself.

File: OrderScreen.java

May 6, 2005

Description: I created and completed the Artists, Albums, Genres, and Songs tables in MySQL, all with the correct form and correct relationships to other tables. I should not have to make any further additions to these tables, as they seem to work fine and contain everything they were supposed to contain. Also, with relative ease, using a cut-and-paste method, I successfully pulled information about Genres, Artists, and Songs out of the database and into their respective list boxes by using what I created on May 5 (I got the Albums list box to correctly pull the information it needed). Overall, I got a big part of my project done (in terms of using relational databases).

File: OrderScreen.java

May 9, 2005

Description: I am now able to pull not only customer information and save it to its table, but also Party Info as well. When saving info about the party, the correct customerID is saved into the orders table, so that every order corresponds to an entry in the customer table, making them related (primary/foreign key). My next task is to somehow figure out a method for saving preferred songs/albums/artists/genres/equipment for the orders. This may be a bit difficult, because there is no limit on how many of each type could possibly be preferred, so I have to figure out an efficient way to store this into a table. I also added another Panel called Payment Info. This is where I will obtain info for financial data.

File: OrderScreen.java

May 10, 2005

Description: Fixed the Layout of the Equipment Panel that is Similar to the Music Panel.

File: OrderScreen.java

May 11, 2005

Description: On the Main Menu screen, there are 4 buttons. 2 of them have functionality (new customer order and returning customer order). I added functionality for a third one as well (the button named other tasks). When this button is clicked, a pop up menu is shown that has a list of commands to choose from (add music, add equipment, view reports, etc.) When you click on the add music choice, another form pops up (addAlbum.java, no functionality yet) that contains all info required to insert a CD to the DJ's collection. This technique will be used for add equipment as well

File: MainMenu.java, addAlbum.java

May 12, 2005

Description: I have nearly completed the Add Album part of my program. When the button is clicked on the Main Menu, a form pops up asking for required input. You can put an album from an existing artist or a brand new artist, in which the artist will be added to the artist table in the database. Once all info is filled in, the album is saved with correct values to the albums table in the database. Now, I will add the ability to add songs (tracks) for the particular album, that way my client will know which CD's to bring with her.

File: addAlbum.java

May 18, 2005

Description: I can now successfully add a new Album, complete with every track for that Album, to the database, with all correct info. You add an album (regardless of if it is a new artist or not), then, by using the data in the Number of Tracks textbox, my program will ask the user that many number of times for a Song Name (along with song length, and tempo), so all album information is saved. Finally, after my client enters in track information, a few dialog boxes come up that I have dubbed as "Financial Data". My client would like the ability to keep up with profits/losses for her company, so entering a new CD would most likely take money away from the company. In the Financial_Data table (SQL), it also contains information about the description of the transaction, type of transaction (gain/loss), transaction amount, type (music, equipment, order, etc). This is just the start of this side of my program.

File: addTracks.java

June 1, 2005

Description: Added the ability to add different equipment to the database. My dialog box pops appears where you proceed to enter in the information for both the equipment (to keep track of inventory) and financial_data tables (to keep up with profits/losses). This was fairly easy to do, as I just mostly cut and pasted different lines of code from the addAlbum.java file

File: addEquipment.java

June 12, 2005

Description: Finished the Layout of the Payment Information Dialog Box and added it to the program. Now, I must work on functionality. Also, I decided that instead of printing receipts and contracts, I will now instead (with the help of a Java PDF class that was free) create PDF documents of each item, and from there the client can print those documents from Adobe Reader. The file will have the format **LastNameDate.pdf**. I actually got my program to pull information from the database into the PDF file to check to see if it actually would work, and it did. Now, all I have to do is organize the information the way I want it to appear on the PDF receipt or contract.

File: OrderScreen.java

June 15, 2005

Description: Modified the PDF technique a bit, as I found out how to insert the current date in the filename of the file, so that my client can easily find out specific receipts, contracts, etc.

File: OrderScreen.java

June 30, 2005

Description: All correct party information is now saved into the database (customer info, party info, request info, and financial parameters) just the way I want them to be saved. This is pretty much the meat of my whole program, and it looks like the main part is just about finished. I still need to refine some of the other options (printing a receipt, contract, song list, etc), but as far as completing and storing orders, this is pretty much done. I started working on printing a song list that my client requested she be able to do, and after doing a join throughout three tables, I finally came up with the right query. Now, I need to somehow get Java to communicate with the printer so that it can print the contents of the JTable (which is how I checked that query), but I will probably just end up using the technique of making a PDF file, and then my client can print the master song list from there.

Files: OrderScreen.java, printSongs.java, MainMenu.java

July 16, 2005

Description: Successfully completed the printing of song lists from the database. I have the option of printing two types of lists- one sorted by the name of the song, and one sorted by the name of the artist. This will allow my client's customers to easily find their song/artist of choice. I also started working on the financial pdf file that my client can print out and figure out her profits/expenses of the company. However, I haven't figured out the best way to present the information on the pdf file.

Files: printSongs.java, printArtists.java, financialReport.java

July 19, 2005

Description: I finally figured out the way I wanted to present the information on the profits/losses report sheet. I programmed my application to print all information in a table (which I will refine and clean up soon). At the bottom of the table, I add up the total of all profits, the total of all expenses, and figure out the difference between the two, so my client will not have to figure out that on her own. I need to talk with Dr Briner and figure out the date of my presentation. Until that date, I will clean up my program and test it for possible bugs/errors.

File: financialReport.java

July 22, 2005

Description: Looking online, I found this easy to use SMTP client that will let you send email without using an email client (Outlook, etc.). I wrote a test program that tested the class out, and it actually worked. I think I am going to try to implement it into the program. It should be relatively simple.

File: SMTPClass.class

July 24, 2005

Description: I made a simple email client and put it into my application. I couldn't figure out how to send email to multiple clients, so maybe I can implement that in a later version. The options I added is the ability to change the default email address, and the option to change the smtp address of the user of the system (if it should ever happen to change). These two values are stored into a table called `program_info`, which saves important data about the program. Later, It will store the password that allows access to the system.

File: email.java
