

July 30, 2005

Description: Basically finished with the program. Added the option that will allow the user to change the password to the system. Also, created a simple new logo for the company in photoshop, as my client said she wouldn't mind something new. This logo will be seen in the program, as well as the header on the receipt/contract.

File: password.java

July 31, 2005

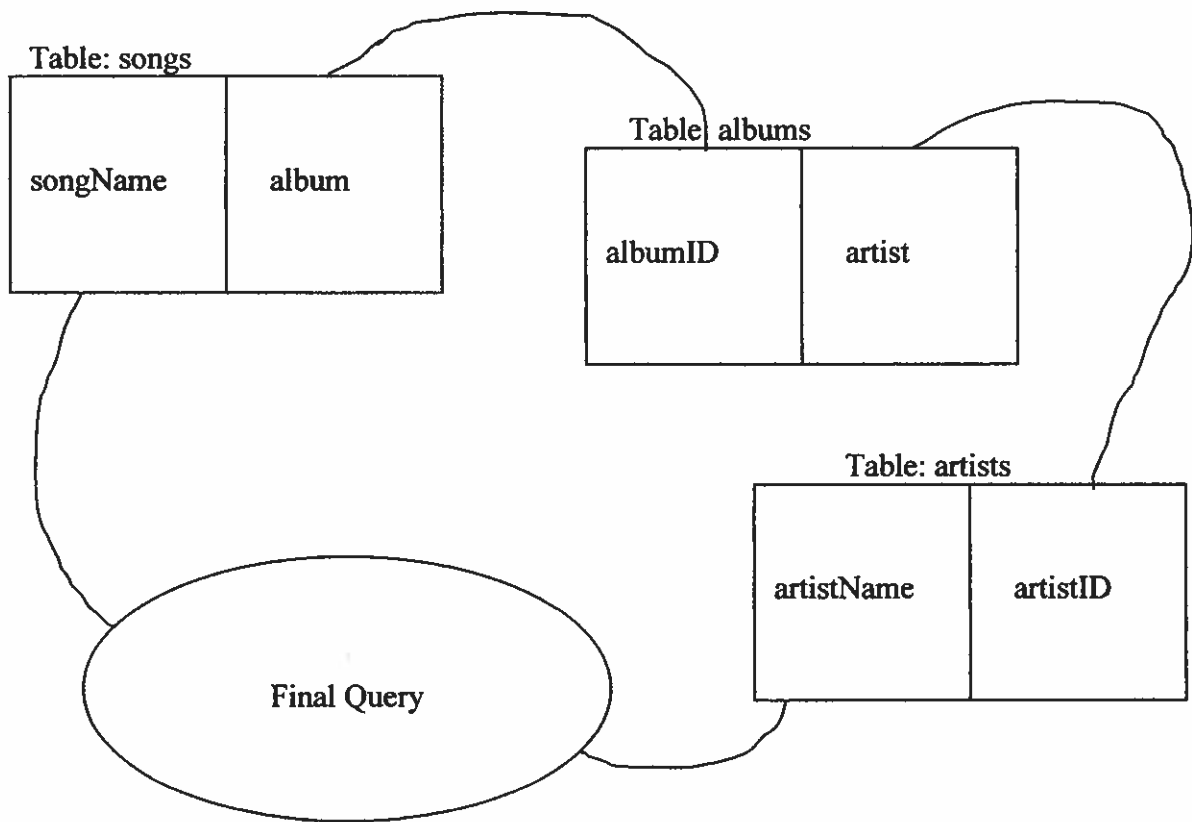

Description: Touching up all areas of the program. I am actually going through and making sure I click on everything that there is to click on, seeing if I get some kind of error, and trying to correct it. Made another option in the main menu called "About". I think all programs have this kind of option. It just gives the version number of the program, and I also took the time to credit all the major resources that helped me accomplish my goal.

File: MainMenu.java

August 1, 2005

Description: I got my friend Roger to sit down at the computer and make suggestions (possibly for a later version) and also to bug test the system. He found a few things that I was quickly able to fix. Results of the bug testing is documented in another file.

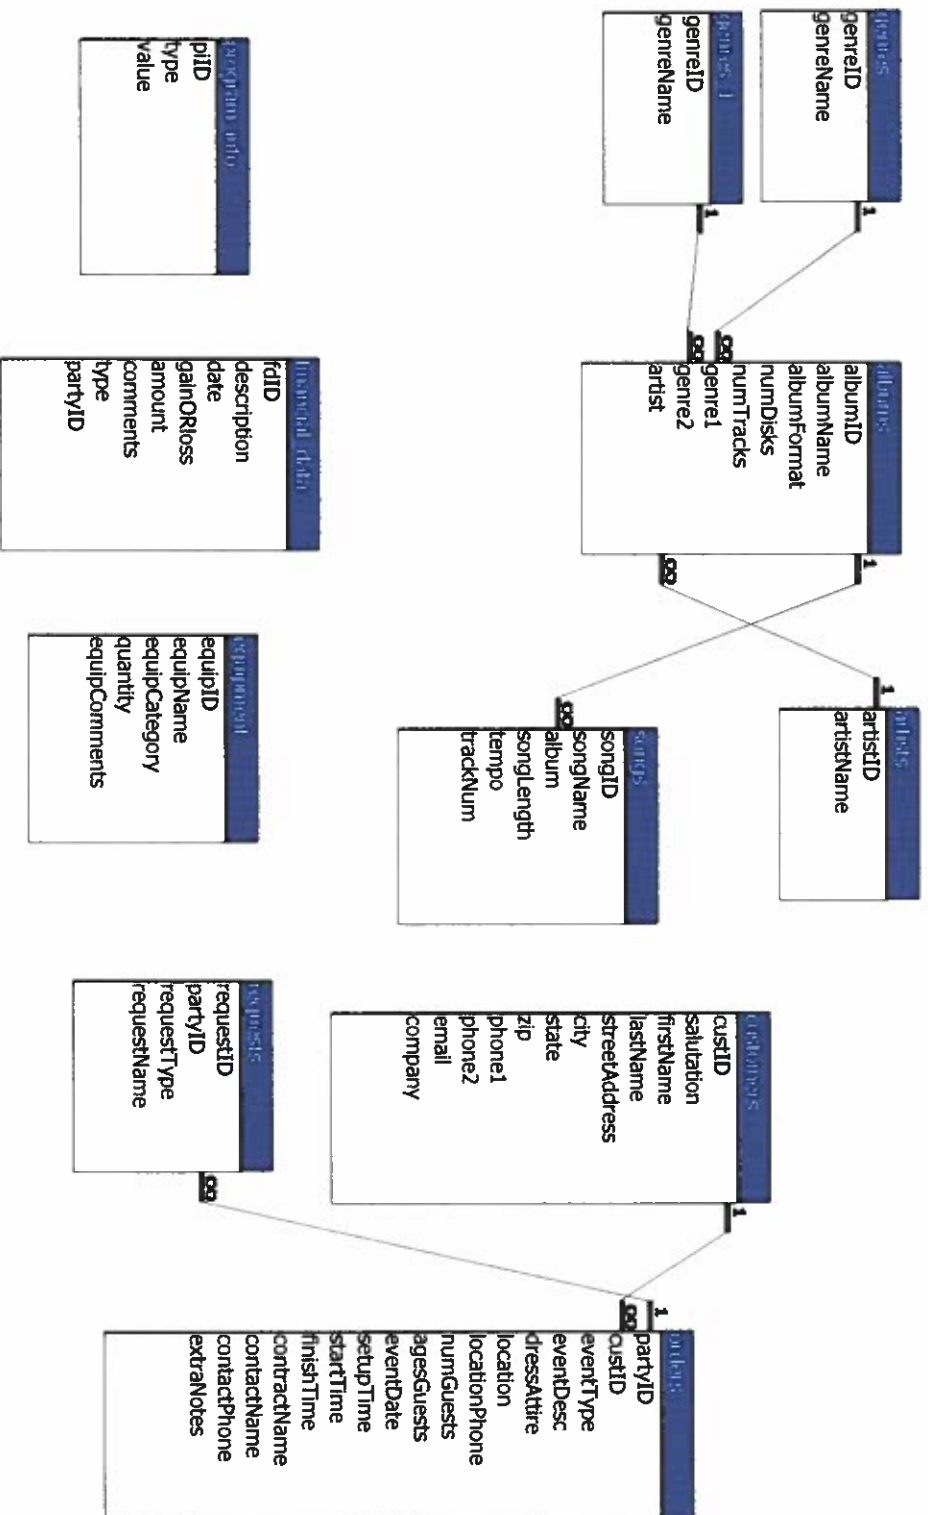

Relationship between songs and artists

```
SELECT songs.songName, artists.artistName FROM artists, songs, albums WHERE  
songs.album = albums.albumID AND albums.artist = artists.artistID.
```

Music Unlimited Beta Version Detailed Bug Report

Performed on August 1, 2005

Done by Roger D. Hughes

1) Order Screen

Tab Traversal

Address box on the Customer Info Tab would not tab out properly.

Instead, the address box would just scroll ahead and never actually tab out of the text field.

File: OrderScreen.java

Level of Severity: Medium

Bug or Annoyance: Annoyance

Status:

2) Order Screen

Tab Traversal

When traversing through the form, I noticed that the tabs did not go in the order you would think they should.

File: OrderScreen.java

Level of Severity: Medium

Bug or Annoyance: Annoyance

Status:

3) Order Screen

Ages of Guests

I suggest that there be a drop down menu allowing the user to pick the type of people at the party (children, teens, young adults, older adults, elderly, etc.)

File: OrderScreen.java

Level of Severity: Low

Bug or Annoyance: Annoyance

Status:

4) Order Screen

Date of Event

I suggest that since the date field is format-sensitive, it probably would be better to provide a drop down menu for each of the month, day, and year fields, and then, by getting the selections of the user, put together the date in the right format, then send it to the database.

File: OrderScreen.java

Level of Severity: Low

Bug or Annoyance: Annoyance

Status:

5) Adding Songs

Enter does not submit information.

I suggest that by pressing enter when adding songs of an album to the database, that the user should be able to press enter instead of having to press the “next” button.

File: addTracks.java

Level of Severity: Low

Bug or Annoyance: Annoyance

Status:

6) New Equipment

Does not show up as added.

When adding a new piece of equipment to the database, I should be able to see it in the equipment list on the order screen (as if I wanted to request it for an event). Instead, it does not show up in the list.

File: OrderScreen.java

Level of Severity: High

Bug or Annoyance: Bug

Status:

7) Text Input

Cannot input certain characters

I noticed when entering quotation marks or an apostrophe into any text box, the program throws an error in the syntax of the SQL query.

File: Any file with text input

Level of Severity: High

Bug or Annoyance: Bug

Status:

8) Returning Customer Info

Disable editing customer on the order screen

I suggest that when a customer is a returning customer, the text boxes containing their information should be disabled, as there is separate area of the program that is responsible for editing existing customer's information. If you change the info of the customer on the Order Screen, the new information will not be saved anyway, so why enable it. The user may think that they can change the information during the order, and get confused.

File: OrderScreen.java

Level of Severity: Medium

Bug or Annoyance: Annoyance

Status:

9) Songlist Reports

Clicking the X (Close) button while viewing a report.

When I tried closing both songlist reports, the entire application shut down.

File: printSongs.java printArtists.java

Level of Severity: High

Bug or Annoyance: Bug

Status:

10) Email

Body Text box on Email Screen

When I typed characters in the body text box, instead of going to the next line when the edge of the text box was reached, it instead kept typing on the same line and added a horizontal scrollbar. It would be hard to read if the email was very long.

File: email.java

Level of Severity: Medium

Bug or Annoyance: Annoyance

Status:

11) Email

Confirmation of Email even when address does not exist.

When I typed in a false email address (one that did not exist), the program said that it successfully sent the email without error. This cannot be true.

File: email.java

Level of Severity: Low

Bug or Annoyance: Annoyance

Status:

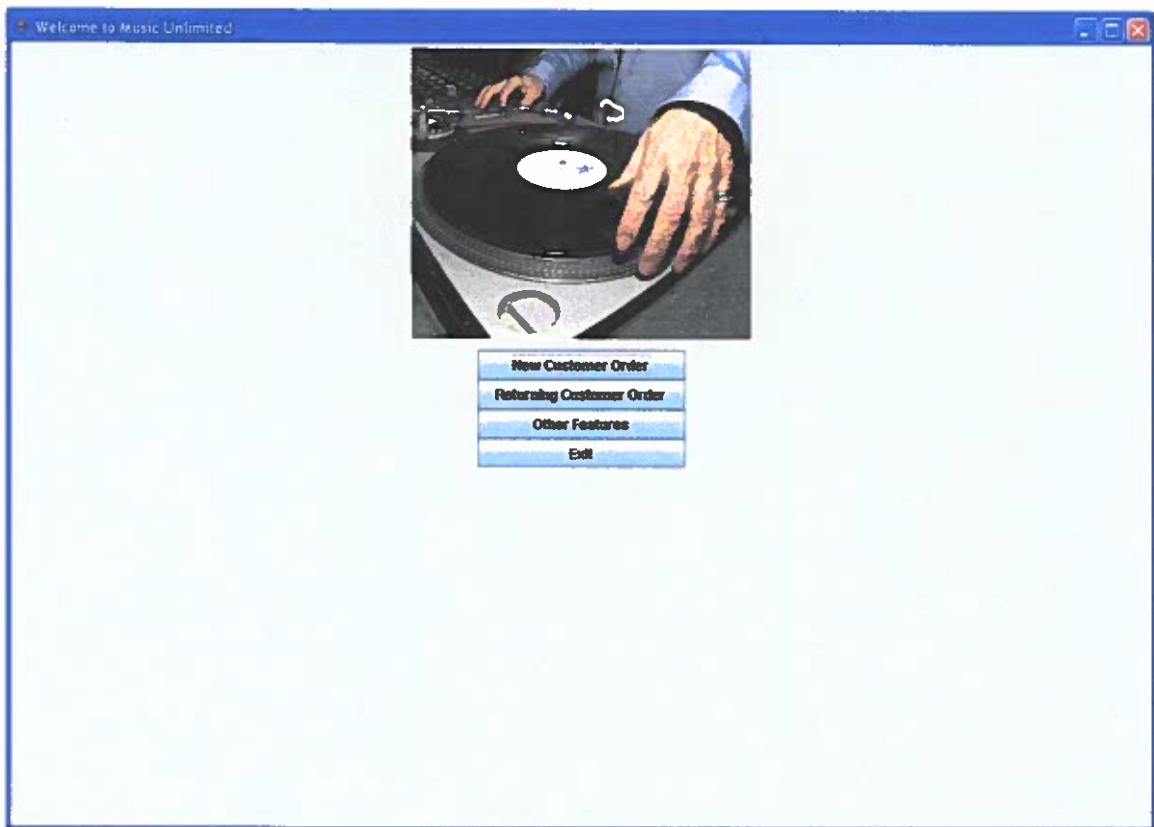

version fixes

Changes made in version 2.0

- *fixed font when creating new report* -OrderScreen.java
- *fixed financial report logo error* -financialReport.java
- *fixed song (by artist) report logo error* -printArtists.java
- *fixed song (by songname) report logo error* -printSongs.java
- *fixed the bug where orderID would sometimes be set as -1* -OrderScreen.java

Music Unlimited Project

List of External Resources

Java GUI Builder

www.d6.34sp.com/davdstudio/index1.htm

Description: I started using this free tool when I realized that I was spending way too much time trying get the layout like I wanted to. After going through all layouts that Java had to offer (Table Layout, Border Layout, Grid Bag Layout, etc.), I found this tool that is a simple WYSIWYG program that will generate a custom layout so that elements will appear in the exact position you placed it. All screens except the Login Screen (FirstScreen.java) and the Main Menu (MainMenu.java) were created with this Java GUI Builder, as they were already created when I found this program.

Pros: Simple to use. Elements appear just like you lay them out.

Cons: Didn't include all elements (like images, for example)

iText

www.lowagie.com/iText/

Description: I knew that my client wanted to generate reports based on information from the database. I could have created a custom print function out of Java, but I found little references to printing in Java in text books and online. Then I decided that I must use some kind of external resource to generate reports, and let this external source handle printing. That's when I found this free Java PDF library. It allows you to create simple or elegant PDF files on the spot. In my program, when there needs to be an "in hand" copy of something, I call on iText to create the document in PDF form, and all my client needs is preferably the latest version of Adobe Reader.

Pros: Website posted code online that showed examples of most features of iText in action. Output ranges from simple text pdf's to graphic fancy pdf's

Cons:

SMTPClient

www.precisonline.com/smtp.html

Description: Nearing the end of the project, I wanted to add another nice feature to the program that I had not discussed with my client previously. In an effort to try to make this ordering process totally electronic via a computer, I figured email would be a good way to let my client's customers know of their order confirmation, and/or emails notifying them of changes in their orders. I knew most of the Java code and syntax for sending email, but due to time constraints, I used this free class and was able to send email with my program within a few hours. The only work I had to do was create the layout of the mail reader. Although the class does include multiple email recipient functionality, my email client will only allow you to send messages to one email address at a time.

Pros: Simple to read code. Any server that allows you to manually connect to their SMTP server can be used. Multiple, Blind, and Carbon Copy recipients can be used.

Cons: No feature to include attachments.

EasyPHP

www.easyPHP.com

Description: When I decided to use SQL as the language to retrieve/send data to the database of my program, I had to first learn how SQL worked. So I installed an open source database system called MySQL that uses the SQL language to do its work. One must install MySQL to act like a web server, that will listen for queries that are sent to it, and return the results of that query to the caller. EasyPHP offers an Apache web server and a MySQL server all in one (since web servers usually store some type of information that needs to be inside of a database). The program is very simple to install and use, and will start the servers in the background without too much interaction with the user.

Pros: Easy to install. Includes a package deal of Apache and MySQL.

Cons:

Music Unlimited Program Version 2.0
List of System Requirements

Windows XP Operating System

1024 x 768 Screen Resolution

mySQL server running on local machine (EasyPHP preferred)

Java SDK (version 1.4.2_06 or higher preferred)

Adobe Reader (to view reports)

Internet Connection (to email client)

Music Unlimited Program Version 2.0
List of System Capabilities and their Description

** Client can complete orders electronically.*

How this helps: This allows orders to be processed quicker.

How this was done in the past: This whole process was done by hand with user-created forms.

** All orders are stored in the database.*

How this helps: Allows user to view past order information. Eliminates having to store paperwork.

How this was done in the past: Forms were kept on file.

** All customers are stored in the database*

How this helps: Eliminates having to re-enter a returning customer's personal information. Allows client to access personal information.

How this was done in the past: Handwritten forms.

** Program will create an order bill and an order contract for each order.*

How this helps: Eliminates paperwork. Saves time.

How this was done in the past: User-created contract and bill.

** Ability to email customer*

How this helps: Notify customer of important information, such as their order being confirmed, or of a change in their order.

How this was done in the past: N/A. Customers never emailed.

** Inventory of Music and Equipment are stored.*

How this helps: User will know exactly what he/she owns for the business.

How this was done in the past: N/A. No inventory information kept.

** Song List based on music inventory can be generated.*

How this helps: Customer can look at the report (either sorted by artist name or song name) and select songs to be played at their event. User is 100% sure that they can offer this selection (since this is the company's actual music collection).

How this was done in the past: Another company's song list was used for this company. (No joke).

** Financial Data for the company is stored, and report can be generated.*

How this helps: User can get an better idea of the company's profits vs their expenses, as orders are stored as profit, and music/equipment bought for the company is stored as expense.

How this was done in the past: Client and her husband would sit down and go through all paperwork to figure this out.

** Program provides security feature.*

How this helps: Only user can access all this information with correct password.

How this was done in the past: N/A.

Senior Project Presentation

Chad Droze
August 8, 2005
CSU COINS Department

Music Unlimited

- A Local Disc Jockey Business run by my client out of her home.
- She does this on the side usually on weekends.
- Mostly services the tri-county area.

The Problem

- Music Unlimited has no efficient way to complete customer's orders in place.
- Currently, she completes orders by hand.
- They also do not have any way to keep track of any inventory.
 - Makes it difficult to inform customers of what she has to offer.
- Too many handwritten forms to keep on file.

Design and Approach

- To make a user friendly Java Application that my client can run on her personal computer that will quickly and efficiently complete and store her orders.
- Since data storage and processing would be frequently occurring, the best approach would be Java with a database language backbone.
- MySQL is an open-source RDBMS that uses SQL (Structured Query Language) to store and retrieve data.

Timeline of Milestones

- August, 2004- Started thinking of project ideas.
- September, 2004- Decided to tackle this project.
- December, 2004- Finished a mock system in MS Access that gave me and my client a better visualization of what was going to happen.

Timeline of Milestones

- March, 2005- Creating GUI of main screen. Program pulls customer information out of the database.
- April, 2005- Program pulls music/equipment information out of the database.
- May, 2005- Program saves orders to the database. Music/Equipment can be added to the database as well.

Timeline of Milestones

- June, 2005- Program can generate reports based on queries to the database.
- July, 2005- Final touches put on the program. Capability to send email to customers within my application is added.

System Capabilities

- Changed very little throughout the project.
- Main requirements were met-
 - Create order and save information.
 - Save information about customers, with the ability to remember them in the future.
 - Thus preventing data "to be entered more than once."
 - Input company assets into the computer.
 - Music
 - Equipment

System Capabilities

- Main requirements met
 - Generate a bill and a contract for the customer.
- Along the way, extra capabilities were added.
 - Financial information was able to be stored.
 - Money subtracted when expenses occurred.
 - Buying new CD, equipment, etc.
 - Money added when order was made.
 - Report can be generated that will provide details of these transactions (sorted by date).

System Capabilities

- Extra capabilities added.
 - Email client added within the application allowing user to email any customer if needed.
 - Prevents "program switching"
 - Security measure added
 - 1 user setup for the system that is password protected.
 - Password can be changed.

Implementing the System

- After creating and testing the application on my own machine, I quickly had to come out with another version when I tried to implement the system on my client's machine.
 - Some of the pathnames I used to create and locate files were not the same since I changed systems.
 - She was currently using 800 x 600 screen resolution (and my machine was 1024 x 768). When I installed the Java class files on her machine, all my windows were shifted halfway off of the screen.
 - This is when I realized the importance of testing software on a wide range of different systems.

Requirements

- Windows OS
- 800 x 600 screen resolution.
- Java Runtime Environment
- MySQL server running on local machine.
 - EasyPHP (freeware) recommended.
- Adobe Reader (6.0 or higher recommended) to view reports.
- Internet connection required to send email.

Benefits as a Result of this System

- Because the main requirements were met:
 - Complete and save orders
 - Keep track of inventory
 - Ability to view data and create reports.
- My client is able to start using this system immediately to assist her with the business.
- This was the whole goal of the project.

Results

- I have developed and put a system in place that is strong enough to handle these tasks, yet flexible and versatile enough to where more features could be added later in the future.
 - Tables designed with the idea in mind that it could support these new features.
 - Since the foundation of the system been established, these features can be added in a reasonable amount of time with very little modification of the current implementation.

In the Future

- These new features include:
 - Giving the program's customer email list an "address book" feel.
 - A scheduling manager that would include calendars. My client could view upcoming events on this calendar.
 - Program would also prevent events from being double booked.
 - Implementing this system to the web (for creation of a company web site.
 - An electronic music library.
 - The table could include a field called pathname, that would give the location of the song file on the system.
 - A playlist could be generated and an audio CD could be created.

Support System

- I do intend to provide help and support for my system in the future once my client has had a reasonable amount of time to use the program.
 - Updating bugs/common program annoyances.
 - Working with my customer once again to get ideas for new features.
 - Implementing these features in later versions.

Benefits of Senior Project

- Great emphasis on planning
 - Understanding the requirements for software and the best way to develop them.
- Improved programming skill
 - Greatly improved my Java knowledge.
 - Learned SQL and understood how a database server really works.
- Being able to work with a client
 - Importance of communication throughout the entire project.
- Software engineering as a whole.

Music Unlimited

Possible Additions/Fixes in Later Versions

Version 3.0/4.0

- Ability to go in (sort of like an administrator) to the database and manually delete orders/customers without having to go through the mySQL command window. My client may make mistakes and need to be able to easily delete these entries. In this case, all tables containing entries with this customer/order ID need to be deleted as well (Cascading deletion)

- Need to modify the payment method of my program. In her business, my client usually pays someone to help setup/breakdown for the event. So, the current payment method isn't a true reflection of the actual business gain (because it doesn't include the business cost of this setup person).

- Add ability to email multiple clients.

- Add ability to include attachments on emails.

- Add ability to edit an existing order (to change the requests, for example).

- Include costs for requesting equipment (a flat-rate fee) and include this fee into the final cost of the event.

- Make my application compatible with any screen resolution.

Versions after 4.0

- On the Order Screen, include the ability to view the selected customer's previous order history.

- Enhance the customer email list by giving it more of an address book feel to it.

- If the event happens to be a wedding, give my client the option to fill out the required additional wedding forms that the company uses now (this was originally supposed to be included in the initial release)

- Implement a schedule manager that would include calendars and reminders of upcoming events. This scheduling manager would include a mechanism that would prevent my client from "double booking" an event on the same day.

- Take the ordering process to the web (most likely using PHP and mySQL). Allow the customers to input the information about their own event. This system would have to have full access to the music and equipment inventory, so the customer could fully customize their event. After sending this information to my

client, she would review what the customer entered, and send an email to the customer either confirming or rejecting the order (rejections mostly due to the desired date/time of the event).

-Make my client's music collection totally electronic. An example scenario would be as follows: my client could download her entire music collection to her computer (this would definitely require a separate dedicated system). When the order was confirmed, a playlist would be generated (possible external communication with Window Media Player or WinAmp) that would include specific song/artist/genre/album requests. Then, my client could burn customized audio CD's that would be used at the event. The CD could later be given to the customer to show appreciation for choosing my client's company.
