Participation in the act of gambling has various disadvantages. These disadvantages are not only from losing, but also from State, Federal, and overall moral penalties. The state of South Carolina contains various laws pertaining to gambling and all of its variations. The United States federal government has some laws about gambling as well, but some issues are left for individual states to take care of. Morally, gambling is an issue that not only affects a person overall but is also against some of the Biblical issues that God gave mankind to obey.

The state of South Carolina contains numerous laws against gambling. Gambling, excluding the state lottery, is illegal in South Carolina. In 2007, a House bill, H3201, was introduced but has not yet been approved. The bill's purpose is to allow the play of various poker games as recreational activity as long as it is held within a person's residence. If it is approved, online gambling would be ok in the home as long it is for the sport and not for winning different prizes. (Humphrey) There are different punishments for different forms of gambling, but all include a form of a fine and/or imprisonment in the state of South Carolina. Online gambling is the same as any other gambling. Whether the state laws declare specific online games illegal in the state or not they can be categorized under parts of the law. If a person is playing poker online, it is still a card game for the purpose of gambling which is against South Carolina law (Carolina Gambler).

The United States Federal laws against online gambling are mainly dependent upon the individual states' laws, but Federal laws are also in place. The Federal Wire Act declares that it is illegal to participate in any form of gambling in accordance to athletes or sporting events over the wire. This law prevents gamblers from placing bets over the internet for sporting events or the athletes competing (Online Gambling). President Bush passed a law in 2006 making it

“illegal for American financial institutions to process transactions from or to online gambling operators” (Online Gambling).

The Bible does not say word for word that we should not gamble, but the act of gambling goes against other warnings declared in the Bible. The verse 1 Timothy 6:10 states that, “The love of money is the root of all evil. Those who crave money wander from the faith and face many sorrows”(Holy Bible). It is difficult to determine what is the right and the wrong way to gamble and how to determine in what form online gambling is or is not lawful. Regardless, we know that gambling has its benefits and its drawbacks. To keep people mentally and physically healthy it would be best, even though near impossible, to completely make online gambling illegal globally. A more realistic approach would be to determine which types of online gambling games are ok Biblically and which will not create an addiction or harm the person in any way. In “Global Law” it would be appropriate to allow gambling games if there was nothing physically to bet or win. If participating in a game required a credit card number to charge to or giving up something worth value it should be banned. Forcing banks and financial institutions to not allow money to be sent to online gambling companies may be one approach to make this law possible. Otherwise the Global Law enforcers could find games that forced players to pay their way into the game; the enforcers would have to force a shutdown of that specific game. Jesus stated in Luke 16:13 that, “No one can serve two masters. For you will hate one and not the other. You cannot serve both God and money”(Holy Bible). This Global Law would be appropriate because if online gambling was for the purpose of gaining money it would be Biblically unethical. There could be an issue where people become addicted to playing for the game and not for the money. This would also be bad and the person would place the game as one of the masters the person is “serving”. If this became an issue, all online gambling could be

banned and Global Law could have a controlled website where they allowed certain games to be played. The gambler would have to login to play the games and the player would only be able to play one hour per day before being kicked off the website. Addiction is a major issue when discussing gambling. The verse found in 1 Peter 2:11 warns to “keep away from worldly desires that wage war against your very souls”(Holy Bible). It is a person’s choice to continuously get involved in gambling, and they should be able to figure out on their own that they are addicted and should not be involved in gambling. At the same time a murderer should know not to murder but the person does it anyway, which is why laws have to be placed and enforced.

On the opposing side many people would disagree with the Global Law to get rid of paid gambling. The reason many people gamble is not for the fun of the games, but for the rewards and winning large sums of money. Complaints about removing the point of gambling would be mentioned, but gamblers should realize that the online games could be lawfully removed altogether and made illegal so the games themselves cannot be played. If people desire to gamble with money or other items of value they should go to a territory that legally allows gambling. Gambler’s may mention that online gambling is easily accessible since it can be done from home or the person gambling may say they have plenty of money and nothing to lose. These are valid points, but these are the reasons to enforce laws against online gambling to protect the people not only financially but from becoming addicted.

There are disadvantages to online gambling and laws are set and enforced to protect the citizens within the territory of the laws. The Global Law, in respect to online gambling, could enforce a great way to protect people. Online gambling is very easy to access, which makes it easier for people to lose their wealth without having to leave the house. South Carolina and the

United States Federal Government have laws against gambling , but morally a person must be willing to not get involved in gambling since there is usually always a way to break the laws.

Creating software, web pages, and other technologies to be utilized by all people is a growing requirement and is important in the development of technology. Computer specialists have the capability to create objects and programs to fit the needs of people with disabilities. According to an article by Robert Luke, "Around twenty or more percent of people have either a physical or learning disability that may prevent them from accessing information by technology" (<http://www.publicsphereproject.org/patterns/print-pattern.php?begin=75#>). If businesses realized that statistic, many of them would take the extra effort to accommodate for people with disabilities; which would create an opportunity for more people to recognize and use their products or services. Implementing this idea of accommodating for the disabled has already taken effect in government websites. There are benefits and detriments to making services available to people with disabilities, but eventually the technology services need to adjust for the disabled.

In the book of Matthew chapter 25 verse 40 Jesus states, "I tell you the truth, when you did it for one of the least (in the estimation of men) of these My brother, you did it for Me." This is a huge statement in the terms of providing for those who are disabled. Many people view the disabled as "one of the least of these"; according to this verse, Jesus wants us as computer scientists to use our knowledge to help the disabled use technology at the capacity of a person that is not disabled.

The current economic crisis has put many companies on a tight budget which causes problems with trying to convert or accommodate for disabled people. The older companies that did not have the resources that we do now to provide for the disabled did not implement

anything in their software or websites to be used by people with disabilities. Companies that are just starting should go ahead and apply these resources at creation time, so that they do not have to go back later and spend a lot of money trying to accommodate their developments (<http://www.raspberryfrog.co.uk/articles/costs-of-fixing-an-inaccessible-website.htm>). It is reasonable in our economic status for older companies to wait to convert their resources until they have the income to change them. The main reason is that many companies are trying to keep themselves in business, and spending their money on accommodating for the disabled is not a requirement right now. Eventually everyone should convert for the disabled and by doing so it may even bring in some extra customers. I believe that there will be a time when it is unlawful for companies to not provide an option for disabled people to use their technologies. Programmers for these companies must recognize that the ACM Code of Ethics states that, "All individuals would have equal opportunity to participate or benefit from the use of computer resources regardless of race, sex, age, disability or other similar factors; discrimination is a violation of the ACM policy and will not be tolerated" (<http://www.acm.org/about/code-of-ethics/#sect1>). This clearly states that as computer scientists we must provide the resources in our work so that anyone can use what we develop.

It is important to provide a fair opportunity for everyone to use different forms of technology such as: websites, videogames, software, etc. People who are not disabled forget to realize the importance of supplying disabled people with resources that they are able to use. If those people were to become disabled they would then notice the importance. It is not fair to push people aside who are different, especially when we are capable of giving these people as

much of an equal opportunity as anyone else. We have technology to help people, so why not use it to do simply that.

The advancement of technology has shown a major downfall. The downfall that many of us try to prevent from happening to us is hacking. Over time it has become easier for an ordinary person to become a hacker because technology is becoming progressively more user friendly. It is frightening to realize that anything a person does online could result in their personal information being stolen. Computer scientists must take this problem into consideration whenever they are developing a webpage or anything that is going to be broadcast over the internet. Online developments need to be secured to the best of a computer scientist's ability and maybe more.

Recently, hackers have been caught obtaining remarkable amounts of information from a large span of people. Many of these people do not realize that their personal information has been stolen and there is no real warning to help them. According to an article by Jordan Robertson, "The victims of hacks are everyday people who enter their password to login to facebook and bank websites or may send their information through an e-mail." Having a facebook password stolen is not a major problem unless a person uses the same username and password for other accounts. If a person's bank account information is stolen or if a hacker is able to get into the bank's database or network, the bank and its clients will face major problems.

The security firm Prevx has immensely helped catch these hackers. In one find Robertson states, "Prevx found a website that was gaining data from 5,000 newly infected computers daily." Prevx has also found government computers that have been hacked. In one situation the logins for one of the government's health care providers was hacked. It is impossible to completely stop hackers, which is

why it is imperative that we create more programs that work like PrevX. Technology will continue to advance and by doing so it will only make hacking easier and more effective. Advancement will not only help hackers, but also help with defense against hackers. The article by Robertson gives a great example of how technology advancement has helped both sides, "PrevX's researchers stopped a hacker website because it was protected with poor encryption. This find shows us how even sloppy crooks can obtain enormous amounts of information through armies of infected computers that spread the virus to others." These statements show that hacks can be detected and stopped, but they can also be easily created and can cause enormous damage.

The everyday user should take every precaution to keep their personal information safe. The best way for a person to start protecting themselves is to do a little research and read about how to protect their information. Another way for a person to protect their information is for that person to make sure that the information they share is well protected and secure by the website or company. Personal information should not be shared through email if possible, and caution should be used anytime that they access the World Wide Web.

Hacking is a serious issue and as long as technology is around, someone will try to hack and steal information. It is important for the public to have computer scientists working hard to find ways to fully protect data. Experts creating programs or websites need to take extra care to protect all necessary information.

Anagram: Project 4

Chris Wyant

Storage

Arrays

- Char arrays
 - Given input from user
 - Current dictionary item
 - Count for each letter in the input array

Count array

- Once the letter is used, it's count decreases to 0
 - Stops the letter from being used twice, unless the input had 2 of the same letters

Sort

- Sort the dictionary by length of the word
 - Gains time for finding anagrams of shorter input
 - Skip sorting the dictionary if the input is close/at 30
 - No use in sorting if the whole dictionary is needed
- If the dictionary is sorted
 - Possibly place the words at equal or lesser length into a new file
 - Allowing less amount of words to search

Sort

- Since dictionary is ordered by length, may be quicker to find phrases after searching larger words

Attempts of Interest

Assuming sorting the dictionary by length quickens the speed of searching small inputs

- Break larger inputs in half
 - Search for anagrams using smaller words
 - Put pieces together and search through larger words, and what is left

• If it is fastest with small inputs, make the larger inputs small

Attempts of Interest: Pseudocode

• If input is greater than 20

- Split input in half
 - Search for smaller anagrams from the first half
 - Do again for the second half
- Take original input and search the larger words
 - Use remaining letters (if any) and search for phrases

Attempts of Interest: Issues

- When splitting the word in half, some letters will be in one half that are not in the other
- Would consist of 3 total searches for longer words
- May actually take longer

Other ideas

- Split dictionary into two files
 - One file contains words of length less than 15
 - Second file contains the larger words
- Allow the use of only smaller words when needed
 - Ex. Finding a small word from the remaining letters

Hyped

Energy Drink Distributions

Home Page

- Contains links to our products, login, logout, and our purchase page
- There is a paragraph containing some information about our company

Products Page

- Contains a images of the brands of energy drinks we supply
- If an image is clicked, the user is directed to the energy drink brand's website

Login

- The user must login to view the purchase page.
- If the user has not registered for an account, there is a link so he/she can do so

Registration

- This page allows a user to create an account so that he/she can login
- Login is necessary for user to view all the pages

Purchase

- Contains images of different brands and flavors of energy drinks that we supply
- Next to each image there is a textbox to obtain the quantity of each product the customer wants
- Once submitted the information is sent to the database

Invoice

- Displays the database which contains the user's purchase
- The database states the drink name, quantity, and total price for that item.
